#### Solution 1: High-dimensional Gaussian Distributions

We will use that  $||X||_2^2$  is in fact a sum of squared Gaussian random variables:

$$||X||_2^2 = \sum_{i=1}^p X_i^2.$$
 (S)

(a) Using (S) we derive directly

$$\mathbb{E}(\|X\|_2^2) = \mathbb{E}\left(\sum_{i=1}^p X_i^2\right) = \sum_{i=1}^p \mathbb{E}X_i^2 = \sum_{i=1}^p 1 = p,$$
 (E)

since  $X_i \sim \mathcal{N}(0,1)$  for each  $i = 1, \ldots, p$ . Again using (S) we obtain

$$\operatorname{Var}(\|X\|_{2}^{2}) = \operatorname{Var}\left(\sum_{i=1}^{p} X_{i}^{2}\right)$$
 (Using (S))
$$= \sum_{i=1}^{p} \operatorname{Var}\left(X_{i}^{2}\right)$$
 ( $X_{1}, \dots, X_{p}$  are i.i.d.)
$$= \sum_{i=1}^{p} (\mathbb{E}(X_{i}^{4}) - \mathbb{E}(X_{i}^{2})^{2})$$
 ( $\operatorname{Var}(Y) = \mathbb{E}(Y^{2}) - \mathbb{E}(Y)^{2}$  for any rv  $Y$ )
$$= \sum_{i=1}^{p} (3-1)$$
 (Using the hint:  $\mathbb{E}_{Y \sim \mathcal{N}(0,1)}(Y^{4}) = 3$ )
$$= 2p.$$

(b) We write

$$||X||_2 - \sqrt{p} = \underbrace{\frac{||X||_2^2 - p}{2\sqrt{p}}}_{=(1)} - \underbrace{\frac{(||X||_2^2 - p)^2}{2\sqrt{p}(||X||_2 + \sqrt{p})^2}}_{=(2)}.$$

It holds that

$$\mathbb{E}[(1)] = \mathbb{E}\left[\frac{\|X\|_2^2 - p}{2\sqrt{p}}\right]$$

$$= \frac{1}{2\sqrt{p}} \left(\mathbb{E}\left[\|X\|_2^2\right] - p\right)$$
(Linearity of expected value)
$$= \frac{1}{2\sqrt{p}} \left(p - p\right)$$

$$= 0.$$

On the one hand, it holds that  $0 \le (2)$ , as all terms are non-negative and consequently  $0 \le \mathbb{E}[(2)]$ . On the other hand, since  $||X||_2 \ge 0$  we have

$$\begin{split} (2) & \leq \frac{(\|X\|_2^2 - p)^2}{2p^{3/2}} \\ \Rightarrow & \mathbb{E}[(2)] \leq \mathbb{E}\left[\frac{(\|X\|_2^2 - p)^2}{2p^{3/2}}\right] = \frac{\mathsf{Var}(\|X\|_2^2)}{2p^{3/2}} = \frac{1}{\sqrt{p}}. \end{split}$$

Putting everything together:

$$|\mathbb{E}(\|X\|_2 - \sqrt{p})| = |\underbrace{\mathbb{E}[(1)]}_{-0} - \mathbb{E}[(2)]| = \mathbb{E}[(2)] \le \frac{1}{\sqrt{p}}.$$
 (b)

(c) The variance can be bounded as follows:

$$\begin{aligned} \operatorname{Var} \left( \| X \|_2 \right) &= \operatorname{Var} \left( \| X \|_2 - \sqrt{p} \right) & \text{(Variance does not change by constant shifts)} \\ &\leq \mathbb{E} \left[ \left( \| X \|_2 - \sqrt{p} \right)^2 \right] & \text{(For any random variable } Y \text{ it holds that } \operatorname{Var}(Y) \leq \mathbb{E}(Y^2) \right) \\ &= \mathbb{E} \left[ \| X \|_2^2 - 2\sqrt{p} \| X \|_2 + p \right] \\ &= \mathbb{E} \left[ \| X \|_2^2 \right] - 2\sqrt{p} \mathbb{E} \left[ \| X \|_2 \right] + p & \text{(Linearity of expected value)} \\ &= 2p - 2\sqrt{p} \mathbb{E} \left[ \| X \|_2 \right] & \text{(Using (E))} \\ &= 2p - 2\sqrt{p} \mathbb{E} \left[ \| X \|_2 - \sqrt{p} + \sqrt{p} \right] & \text{(Someone told us that it is a good idea)} \\ &= -2\sqrt{p} \mathbb{E} \left[ \| X \|_2 - \sqrt{p} \right] & \text{(Linearity of expected value)} \\ &\leq 2\sqrt{p} \frac{1}{\sqrt{p}} = 2. & \text{(Using (b))} \end{aligned}$$

(d) Since  $Z = \frac{X - X'}{\sqrt{2}} \sim \mathcal{N}(0, \mathbf{I})$ , we obtain from (b) and (c) that

$$\left| \mathbb{E}(\|Z\|_2 - \sqrt{p}) \right| \le \sqrt{\frac{1}{n}},\tag{d1}$$

$$\operatorname{Var}(\|Z\|_2) \le 2. \tag{d2}$$

But

$$||Z||_2 = \sqrt{\sum_{i=1}^p \left(\frac{X_i - X_i'}{\sqrt{2}}\right)^2} = \sqrt{\frac{1}{2} \sum_{i=1}^p \left(X_i - X_i'\right)^2} = \sqrt{\frac{1}{2}} \sqrt{\sum_{i=1}^p \left(X_i - X_i'\right)^2} = \sqrt{\frac{1}{2}} ||X - X'||_2.$$
 (d3)

Thus, (d1) implies

$$\left| \mathbb{E}(\|Z\|_2 - \sqrt{p}) \right| \le \sqrt{\frac{1}{p}}$$

$$\Leftrightarrow \sqrt{2} \left| \mathbb{E}(\|Z\|_2 - \sqrt{p}) \right| \le \sqrt{\frac{2}{p}}$$

$$\Leftrightarrow \left| \mathbb{E}(\underbrace{\sqrt{2}\|Z\|_2}_{=\|X - X'\|_2} - \sqrt{2p}) \right| \le \sqrt{\frac{2}{p}}.$$

Moreover, (d2) implies

$$\begin{aligned} &\operatorname{Var}\left(\|Z\|_{2}\right) \leq 2 \\ \Leftrightarrow & 2\operatorname{Var}\left(\|Z\|_{2}\right) \leq 2 \cdot 2 \\ \Leftrightarrow & \operatorname{Var}\left(\sqrt{2}\|Z\|_{2}\right) \leq 4 \\ \Leftrightarrow & \operatorname{Var}\left(\|X-X'\|_{2}\right) \leq 4. \end{aligned} \qquad \qquad (\operatorname{Var}(aY) = a^{2}\operatorname{Var}(Y) \text{ for any rv } Y \text{ and constant } a) \\ \Leftrightarrow & \operatorname{Var}\left(\|X-X'\|_{2}\right) \leq 4. \end{aligned}$$

(e) As for any  $x, x' \in \mathbb{R}^p$  it holds that

$$\langle x, x' \rangle = \frac{1}{2} (\|x\|_2^2 + \|x'\|_2^2 - \|x - x'\|_2^2).$$

we can infer that

$$\mathbb{E}\langle X, X' \rangle = \frac{1}{2} \left( \mathbb{E} \|X\|_{2}^{2} + \mathbb{E} \|X'\|_{2}^{2} - \mathbb{E} \|X - X'\|_{2}^{2} \right)$$

$$= \frac{1}{2} \left( p + p - \mathbb{E} \|X - X'\|_{2}^{2} \right) \qquad \text{(Using (E))}$$

$$= \frac{1}{2} \left( p + p - 2\mathbb{E} \underbrace{\frac{1}{2} \|X - X'\|_{2}^{2}}_{=\|Z\|_{2}^{2}} \right)$$

$$= \frac{1}{2} \left( p + p - 2p \right) = 0. \qquad \text{(Using again (E))}$$

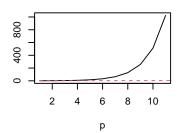

For the variance we obtain

```
\begin{split} \operatorname{Var}(\langle X, X' \rangle) &= \operatorname{Var}\left(\sum_{i=1}^p X_i \, X_i'\right) \\ &= \sum_{i=1}^p \operatorname{Var}\left(X_i \, X_i'\right) & \text{(Independence)} \\ &= p \operatorname{Var}\left(X_1 \, X_1'\right) & \text{(Identical distributions)} \\ &= p \, \left(\mathbb{E}[X_1^2 \, (X_1')^2] - \mathbb{E}[X_1 \, (X_1')]^2\right) \\ &= p \, \left(\mathbb{E}[X_1^2] \mathbb{E}[(X_1')^2] - \mathbb{E}[X_1]^2 \, \mathbb{E}[(X_1')]^2\right) & \text{(Independence)} \\ &= p. & \left(\mathbb{E}[X_1^2] = \mathbb{E}[(X_1')^2] = 1 \text{ and } \mathbb{E}[X_1] = \mathbb{E}[X_1'] = 0\right) \end{split}
```
